two-point touch

1. **Three orthogonal axes** (motion horizontally, vertically and radially)
2. **Contact constraints, opposing the direction of motion**

Design Rationale

Material Properties & Tip Styles

- The motion of the cane tip over a surface transmits sound and vibration from its tip to the hand
- Differences in:
 1. Tactile feedback —Surface textures
 2. Sound effects transmitted

Design Rationale

Grip & Position

- Users adapt their **grip and cane position** depending on the navigation task
- Need for:
 1. Versatility in the controller's degrees-of-freedom such that various positions and grip styles are allowed.

belt-mounted

Three-Axis Brake Design

1. **Three orthogonal axes** (motion horizontally, vertically and radially)
2. **Contact constraints, opposing the direction of motion**

Evaluation

- Assess how the prototype enables independent navigation

Evaluation

- Assess how the prototype enables independent navigation
- Using the sense of touch and hearing, and apply known Orientation & Mobility skills

Evaluation Goals

Evaluation Goals

Realism

1. Can participants apply the same knowledge and skills in using their (physical) white cane to effectively and independently navigate the VE using the virtual cane?

Evaluation Goals

Realism

1. Can participants apply the same knowledge and skills in using their (physical) white cane to effectively and independently navigate the VE using the virtual cane?

Wayfinding

Evaluation Goals

Realism

1. Can participants apply the same knowledge and skills in using their (physical) white cane to effectively and independently navigate the VE using the virtual cane?

Wayfinding

2. Will repeated navigation of the same VE lead to increased egocentric and allocentric familiarity of the space?

Scavenger Hunt in VR

- Navigating a map (6x6m)
- Goals:
 1. Find as many targets
 2. Avoid collisions with hazards and room geometry

Cane techniques divided into four categories of function (APH Guidelines):

1. detection
—> locate targets
2. negotiating obstacles in the travel path
—> avoid hazards
3. negotiating doors
—> navigating between rooms
4. following a shoreline
—> avoiding walls and following a walkway

- 5 targets
- 5 hazards
- 1 radio source

Participants

- 8 legally blind users
- All participants used a white cane as their preferred navigation aid with at least 5 years of experience
- Four used an NFB **carbon fiber** cane with a **metal glide tip**
- Four used a folding **aluminum** cane with a **nylon pencil tip**

Results

Game Statistics

Results

Game Statistics

- Participants were successful in finding the targets to complete the game

Results

Game Statistics

- Participants were successful in finding the targets to complete the game
- Became more familiar with the environment over time

Cane Techniques & Grip

- Participants **relied on their typical cane strategies**
- Most common **constant-touch** and **two-point contact**
- *“When I use my cane, I don’t glide, I usually do my tap motions. And that’s what I did in the game, but I did glide a bit just to see. So, I did a little bit of both and they were both spot on” (P2).*

Results

Integrating Feedback

Kinesthetic feedback used for: **understanding the geometry**, and **finding open spaces** to walk in

- *“I felt the clear entries where I didn’t encounter walls” (P5)*
- *“[It helped me detect] where barriers were, depending on the barrier type... how far across does it go...” (P1).*

Results

Integrating Feedback

Audio provided spatial information

- “From the target audio cue, **I could know which direction to go** and **approximately how far I had to go**” (P8).
- “**The volume, depending on where you were helped a lot**; because that’s what I usually use [in the real world]” (P5).
- “The audio was super real that’s why I thought there were people around me.” (P6)

Cane Type Preferences

- Differences in performance between users of metal and plastic roller tips
- Plastic tip users had more trouble understanding the meaning of the tactile feedback, and generally performed worse

Results

Cane Material Preferences

- Plastic-tip participants:
 - “The cane was **vibrating a lot for reasons I don’t know**”.
 - “The **sensations are a little different**. To me. It almost felt I had like one of those, I don’t know if you’ve seen, the NFB canes that are really flexible.” (P4)

Results

Cane Material Preferences

- Metal-tip participants:
 - ***“What really set out was the tactile. It seemed so real, specially outdoors...The cement was spot on...”*** (P2).
 - ***“The sweeping was very real... it helped me **locate what things might be...**”*** (P6).
